Home Energy Efficiency –psegliny.com/efficiency

Managing Energy Usage

A typical home has dozens of electronics and appliances, each requiring a certain amount of power, or watts, to operate. The electric meter measures the combined wattage used over time, which then determines the charges on your electric bill.

But power can't be measured in pints or pounds. Electrical energy is measured in kilowatt-hours - or kWh. It's not as intimidating as it sounds:

1,000 (kilo) Watts used for one hour = 1 kWh

Here's another way to look at it:

1 kWh = ten 100W bulbs or one 1000W appliance used for one hour

Knowing the wattage of a particular device will help you calculate how many kWh it will use.

For example, an efficient 18W LED bulb (100W incandescent equivalent) used for 3 hours a day over 30 days will use 1.62 kWh:

$18W \times 90 \text{ hours} \div 1000 = 1.62 \text{ kWh}$

Watts. The Cost.

Using that same 18W bulb as an example, here's a simple equation to estimate the cost of a device's energy use:

$$\begin{array}{c} \text{Wattage} \\ 18 \end{array} \times \begin{array}{c} \text{Hours Used} \\ \text{per Month} \\ 90 \end{array} \times \begin{array}{c} \text{Cost per kWh} \\ 21¢ \end{array} = \begin{array}{c} \text{Cost per Month} \\ 34¢ \end{array}$$

1000

(That's **82% less** than running a standard 100W bulb for the same amount of light!)

Saving energy and money is as easy as managing electronics use, like by turning them off when not needed, and choosing devices and appliances that use energy more efficiently.
